## **INTRODUCTION**

*Thanks you for purchasing a Yoshino HP4 headphone amplifier. You are now the owner of a unique product from one of the world's leading manufacturers of sound recording and reproduction equipment. We trust that it will give you many years of faithful service and musical pleasure. Please take a few moments to read this manual as it gives useful tips on operation and care of your new amplifier.*

## **QUICK SETUP**

*The input to the HP4 should be taken from your preamplifier. Select the balanced or unbalanced input as appropriate. Plug your headphones into one of the front panel jack sockets according to the impedance rating of the headphones. Set the volume to near minimum, connect the HP4 to the main supply and switch on. It takes a few seconds to warm up.*

*To mute your power amplifier from the HP4, take its feed from the HP4's output rather than that on your preamplifier. The 'Power Amp' switch on the HP4 can now be used to mute the power amp, allowing for 'neighbour-friendly' headphone-only listening.*

*The following pages explain the operation and use of the HP4 headphone amplifier in more detail.*
